# **CONTENT**

- 1. Introduction
- 2. Objectives
- 3. Methodology
- 4. Results
- 5. Conclusion
- 6. Future Works

#### **CURRENT SITUATION IN MALAYSIA**

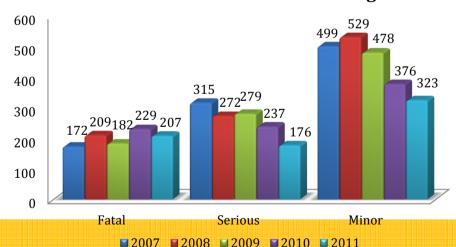

#### **Fatalities at Traffic Light**

Road accidents at traffic light shows an average of 22.8% for fatal, 28.3% for serious and 48.9% for minor injuries

Fatalities at traffic light shows an UPWARD TREND from 2007 until 2011 despite the irregular ups and downs

#### **Road Accidents at Traffic Light**

#### 1. INTRODUCTION

- Primary cause of crashes at traffic light occurred when vehicles entered the intersection on red signal.
- Drivers often face a problem when reaching a traffic light at the onset of amber; whether they have to stop or to proceed
   Dilemma Zone / Option Zone
- Neither possible to proceed straight to clear the stop line nor possible to stop comfortably at the stop line.

# 1. INTRODUCTION (Cont'd)

- Automated Enforcement System (AES) is one of the interventions that can help to curb red light running.
- AES on red light running can be an effective safety measure based on literature reviews detailing on its effectiveness.
- Very limited studies undertaken in this field in Malaysia.
- Malaysian Government was planning to implement AES for the 1<sup>st</sup> time in the country
- This study was carried out to examine the prevalence and identify the factors associated with red light running at selected intersections (proposed AES locations) in Malaysia.

# 2. OBJECTIVES

- To examine the prevalence of red light running at selected intersections in Malaysia
- To identify the factors associated with red light running

## 3. METHODOLOGY

Site Selection 4 locations proposed for installation of AES

#### **Data Collected:**

- •Traffic Volume right/left turn, through traffic
- •Violations right/left turn, through traffic

Data Collection

Cycle length, vehicle type, peak off peak hour, types of traffic light

Data Analysis Chi square & Odds Ratio

**Evaluation** 

Report Writing

## 4. RESULTS

N = 5090

| Average Data Collection |                       |      |      |       |  |  |  |  |  |
|-------------------------|-----------------------|------|------|-------|--|--|--|--|--|
| Vehicle Type            |                       |      |      |       |  |  |  |  |  |
|                         | M/C Cars Others Total |      |      |       |  |  |  |  |  |
| Volume                  | 1502                  | 2731 | 857  | 5090  |  |  |  |  |  |
| (%)                     | 29.5                  | 53.7 | 16.8 | 100.0 |  |  |  |  |  |

- 29.5% motorcycle
- 53.7% cars
- 16.8% others

- Banting highest (18.8%)
- Jalan Klang Lama (11.7%)
- Taiping (10.5%)
- Sg. Siput (8.3%)

|                | Violate | %    | Comply | %    | Total |
|----------------|---------|------|--------|------|-------|
| Jln Klang Lama | 819     | 11.7 | 6193   | 88.3 | 7012  |
| <b>Taiping</b> | 555     | 10.5 | 4741   | 89.5 | 5296  |
| Sg. Siput      | 348     | 8.3  | 3837   | 91.7 | 4185  |
| Banting        | 729     | 18.8 | 3136   | 81.1 | 3865  |

|         | Violate | %     | Comply | %     |
|---------|---------|-------|--------|-------|
| Overall | 2451    | 12.04 | 17907  | 87.96 |

Cycle length was found to be **significant** factor (p<0.05) in violation rates

# 4. RESULTS - Cycle Length

| Cycle Lei            | Cycle Length V |        | te (%)      |      | Comply         |            | Odds       |  |
|----------------------|----------------|--------|-------------|------|----------------|------------|------------|--|
| <b>Short (≤120s)</b> |                | 310    | 13.2        |      | 2039           | 86.8       | 0.15       |  |
| Long (>120s)         |                | 303    | 11.1        |      | 2438           |            | 0.12       |  |
| Total                | otal           |        | 12.0        |      | 4477           | 88.0       |            |  |
| Variable Co-         |                | Standa | ard 95%     | )    | 95% Confidence |            | Odds Ratio |  |
| efficien             |                | t Erro | r Significa | ınce | Interval       | Ouus Ratio |            |  |
| Cycle Time           | 0.20           | 0.09   | 0.02        |      | 1.03 - 1.45    |            | 1.22       |  |

- Short cycle length => 13.2% (310) of the vehicles violated the traffic lights, 86.8% (2039) complied.
- Long cycle length => 11.1% (303) violated and 88.9% (2438) complied.
- Violation rates during short cycle length slightly higher than during long cycle length.
- Drivers short cycle 1.22 times more likely to beat the red light than drivers facing long cycle length.

Traffic light violation was found **not significant** (p = 0.88) with peak and off peak hour

# 4. RESULTS - Peak - Off Peak Hour

| Peak - Off Pea         | ak Hour | Violate  | (%)          | Comply      | (%)  | Odds  |
|------------------------|---------|----------|--------------|-------------|------|-------|
| Peak                   |         | 300      | 12.1         | 2177        | 87.9 | 0.14  |
| Off Peak               |         | 313      | 12.0         | 2300        | 88.0 | 0.14  |
| Total                  |         | 613      | 12.0         | 4477        | 88.0 |       |
| Variable Co- efficient |         | Standard | 95%          | 95% Confid  | ence | Odds  |
|                        |         | Error    | Significance | Interva     | l    | Ratio |
| Time of Day            | 0.02    | 0.09     | 0.88         | 0.86 - 1.20 |      | 1.01  |

• Not much difference in percentage of violation can be observed between peak (12.1%) and off peak (12.0%).

Chi square test done indicates the **significance** of this variable (p<0.05).

# 4. RESULTS - Types of Traffic Light

| Types of Traffic Light | Violate |             | (%)  | Comply      | (%)   | Odds        |               |
|------------------------|---------|-------------|------|-------------|-------|-------------|---------------|
| Fixed Timed            |         | 387         |      | 14.2        | 2332  | 85.8        | 0.17          |
| Vehicle Actuated       |         | 226         |      | 9.5         | 2145  | 90.5        | 0.11          |
| Total                  |         | 613         |      | 12.0        | 4477  | 88.0        |               |
| Variable               | Co      |             |      |             |       | Confidence  | Odds<br>Ratio |
|                        | effici  | cient Error |      | Significano | ce In | e Interval  |               |
| Types of Traffic Light | 0.45    |             | 0.09 | 0.00        | 1.3   | 1.32 - 1.87 |               |

- From a total of 5090 samples, 14.2% violated the red light while 85.8% complied.
- Odds ratio stated that drivers at fixed- timed traffic light are **1.58 times more likely** to violate than drivers at vehicle-actuated traffic light.
- Therefore, the results show that types of traffic light is one of the factors affecting red light running.

The result of chi square test proves this to be significant (p<0.05)

# 4. RESULTS - Vehicle Types

| Vehicle Types | Viol       |          | ate (%) |      |              | Comply |          | (%)          | Odds  |
|---------------|------------|----------|---------|------|--------------|--------|----------|--------------|-------|
| 2 wheeler     | vheeler 36 |          | 5 24.3  |      | }            | 1138   |          | 75.7         | 0.32  |
| 4 wheeler     |            | 248      |         | 6.9  |              | 3339   |          | 93.1         | 0.07  |
| Total         | otal       |          | 12.0    |      | )            | 4477   |          | 88.0         |       |
| Variable      |            | Co- Stan |         | dard |              | 95%    | 959      | % Confidence | Odds  |
|               |            | icient   | Error   |      | Significance |        | Interval |              | Ratio |
| Vehicle Types | -          | 1.46 0.  |         | .09  | 0.00         |        |          | 3.63 - 5.14  | 4.32  |

• Two wheeled vehicles recorded higher traffic light violations with 24.3% compared to four wheeled vehicle with 6.9%

4.32 times more

#### 5. CONCLUSION

Education and enforcement will definitely reduce the tendency to beat the red light especially among motorcyclists.

The results only represent the sample size.
Further study needs to be conducted in order to come out with a result that can be generalized for drivers in Malaysia.

Malaysia's sociodemographic factor and lifestyle

CONTRIBUTING FACTORS TO RLR

Cycle Length

> Types of Traffic Light

 Implementation of suitable engineering countermeasures and automated enforcement to reduce the number of red light running in Malaysia.

Vehicle Type As people tend to violate higher at a fixed timed traffic light, the use of vehicle actuated traffic light is more suitable to solve the issue of red light running.

#### 6. FUTURE WORKS

- Study with larger sample size increase sites throughout Malaysia
- Collect data during night time
- Study the Effectiveness of Automated Enforcement System (AES) in Reducing Red Light Running Violations in Malaysia

DONOT BEAT THE RED Happen
